WORKS RE-SCORED	WORK DOMAINS	SCORING FACTORS	NEW GRAND TOTAL

Scoring model reference · Prepared 11 July 2026

1 Why this model exists

Today's 66 point values were hand-copied from a paper sheet with no rationale behind any of them. When a staff member asks why one work is worth 40 points and another is worth 2, there is no answer on record — and when a new work needs to be added, there is no way to price it consistently. A number you cannot defend is a number you cannot manage.

The new model derives every work's points from how much **time** it takes and how much **skill**, **effort**, and **responsibility** it demands. Skilled, physically hard, and high-stakes work is now rewarded fairly, quick and trivial work settles at its true weight, and every figure is auditable: anyone can open the sheet, read the four inputs, and see exactly how the points were produced.

2 The formula

$$\text{base points} = \frac{\text{time (minutes)}}{\text{minutes per point}} \times \text{Skill} \times \text{Effort} \times \text{Responsibility}$$

The three quality factors are entered on a plain **0–100** scale and converted to multipliers, so a higher rating simply lifts the points:

Factor	Scaling	Multiplier range	Effect
Skill	$1.0 + 1.2 \times (x / 100)$	1.0 – 2.2	up to +120% for expert work
Effort	$1.0 + 0.5 \times (x / 100)$	1.0 – 1.5	up to +50% for hard, dirty work
Responsibility	$1.0 + 0.8 \times (x / 100)$	1.0 – 1.8	up to +80% for high-stakes work

THE ANCHOR

About **5.4 minutes** of ordinary work — unskilled, light, low-stakes — equals **1 point**. Time is always entered in minutes, and all three quality factors sit at their base of 1.0 when the work is ordinary.

ONE HONEST RESCALE

The whole catalogue was multiplied by a single constant ($\alpha \approx 0.5583$) so the daily point target is unchanged. The new grand total is **503.5** versus **506.0** today — the pie is the same size, only the slices are fairer.

Computed points are rounded to friendly increments — to the nearest 0.5 below 10, to a whole number below 50, and to the nearest 5 above that — so the sheet stays easy to read and to award by hand.

3 What the three factors mean

Every rater uses the same definitions, so two people scoring the same work land on the same number.

Factor	What it measures	0 means...	100 means...
Skill	The training and judgement needed to do it right	Anyone can do it, no training	Expert / technical; costly if done wrong
Effort	Physical hardship — dirt, heat, height, confined space	Light / desk work	Heavy, dirty, hazardous conditions
Responsibility	Consequence of an error — money, safety, compliance, trust	Trivial, easily redone	Large money / safety / legal at stake

4 Labour work vs. incentive work

Five of the 66 works are **incentive works** — sales and customer-acquisition tasks whose value is set by business policy, not by the labour formula. Paying these by "time and effort" would miss the point: they are rewarded for the business they bring in, so they keep their current value untouched.

#	Incentive work	Basis	Value (kept)
21	Sell HSD / XTRA GREEN	per ₹1,000 sold	₹0.5
22	Sell MS / XP-95	per ₹1,000 sold	1
33	Add customer to Extra Rewards	per customer	3
36	Sell Servo mobil	per item	8
66	Add a new customer	per customer	3

The other 61 works are **labour works**, priced entirely by the formula above. Incentive works are flagged in the catalogue that follows.

5 The full re-scored catalogue

All 66 works, grouped by domain. **Current** is the old paper value; **New** is the formula result. Read **green +Δ** as re-priced **up** — skilled, hard, or high-stakes work that was underpaid — and **red -Δ** as re-priced **down** — quick, trivial work that was overpaid. Rows marked **INCENTIVE** keep their policy value and are shown for context.

Cleaning *Site, sanitation & upkeep*

#	Work	Distribution	Current	New	Δ	Time min	Skill 0–100	Effort 0–100	Resp. 0–100
1	Clean sales building & driveway	SPLIT	40	25	-15.0	90	5	65	10
